2 evalPol

coef.monpol

Extract Model Coefficients

#### **Description**

coef method for 'monpol' objects.

## Usage

```
## S3 method for class 'monpol'
coef(object, scale = c("original", "fitted"), type = c("beta", "monpar"), ...)
```

## **Arguments**

object A 'monpol' object.

scale Extract coefficients on the original scale of the data or on the scale used during fitting.

type Extract coefficients in the 'beta' parameterisation of the polynomial or for the monotone parameterisation used in the algorithm.

... Additional optionals arguments. At present no optional arguments are used.

#### **Details**

This is the coef method for objects inheriting from class "monpol".

#### Value

Coefficients extracted from the model object object.

#### Author(s)

Berwin A Turlach

evalPol

**Evaluating Polynomials** 

# Description

Function to evaluate polynomials in a numerical robust way using the Horner scheme

# Usage

```
evalPol(x, beta)
```

## **Arguments**

x numerical values at which to evaluate polynomials

beta numerical vector containing the coefficient of the polynomial

fitted.monpol 3

#### Value

The evaluated polynomial

#### Author(s)

Berwin A Turlach

## **Examples**

```
## The function is currently defined as
function (x, beta)
{
    order <- length(beta)
    res <- beta[order]
    for (i in rev(seq_len(order - 1))) res <- res * x + beta[i]
    res
}</pre>
```

fitted.monpol

Extract Model Fitted Values

## **Description**

fitted method for 'monpol' objects.

#### Usage

```
## S3 method for class 'monpol'
fitted(object, scale = c("original", "fitted"), ...)
```

## **Arguments**

object A 'monpol' object.

scale Extract fitted values on the original scale of the data or on the scale used during fitting.

... Additional optionals arguments. At present no optional arguments are used.

#### **Details**

This is the fitted method for objects inheriting from class "monpol".

## Value

Fitted values extracted from the model object object.

#### Author(s)

Berwin A Turlach

hawkins hawk	ins
--------------	-----

## **Description**

This data gives x and y variables for the data published in Hawkins' 1994 article. This data was originally simulated from a standard cubic polynomial with equally spaced x values between -1 and 1.

## **Format**

A data frame with 50 simulated observations on the following 2 variables.

```
y a numeric vector x a numeric vector
```

#### References

Hawkins, D. M. (1994) Fitting monotonic polynomials to data. *Computational Statistics* **9**(3): 233–247.

## **Examples**

```
data(hawkins)
```

```
model.matrix.monpol
```

Construct Design Matrices

# Description

```
model.matrix creates a design (or model) matrix for 'monpol' objects.
```

#### Usage

```
## S3 method for class 'monpol'
model.matrix(object, scale = c("original", "fitted"), ...)
```

## **Arguments**

object	A 'monpol' object.
scale	Create design matrix on the original scale of the data or on the scale used during fitting.
	Additional optionals arguments. At present no optional arguments are used.

#### **Details**

This is the model.matrix method for objects inheriting from class "monpol".

5 monpol

#### Value

Design matrix created from the model object object.

## Author(s)

Berwin A Turlach

## Description

Determine the least-squares estimates of the parameters of a monotone polynomial

#### Usage

```
monpol(formula, data, subset, weights, na.action,
       degree=3, K, start, trace = FALSE, plot.it = FALSE,
       control = monpol.control(),
       algorithm = c("Full", "Hawkins", "BCD", "CD1", "CD2"),
       ptype = c("Elphinstone", "EHH", "Penttila"),
       ctype = c("cge0", "c2"),
       model=FALSE, x=FALSE, y=FALSE)
```

## **Arguments**

formula	an object of class "formula" (or one that can be coerced to that class): a symbolic description of the model to be fitted.
data	an optional data frame, list or environment (or object coercible by as.data.frame to a data frame) containing the variables in the model. If not found in data, the variables are taken from environment(formula), typically the environment from which monpol is called.
subset	an optional vector specifying a subset of observations to be used in the fitting process.
weights	an optional vector of weights to be used in the fitting process. Should be NULL or a numeric vector.
na.action	a function which indicates what should happen when the data contain NAs. The default is set by the na.action setting of options, and is na.fail if that is unset. The 'factory-fresh' default is na.omit. Another possible value is NULL, no action. Value na.exclude can be useful.
degree	a polynomail with highest power equal to degree will be fitted to the data.
K	a polynomial with highest power $2K+1$ will be fitted to the data.
start	optional starting value for the iterative fitting.
trace	print out information about the progress of the interative fitting at the start and then every trace iterations.
plot.it	plot the data and initial fit, then plot current fit every plot.it iterations.
control	settings that control the iterative fit; see monpol.control for details.

6 monpol.control

algorithm	algorithm to be used. It is recommended to use either 'Full' or 'Hawkins'; see paper in 'References' for details.
ptype	parameterisation to be used; see paper in 'References' for details.
ctype	parameterisation to be used; see paper in 'References' for details.
model, x, y	logicals. If TRUE the corresponding components of the fit (the model frame, the
	model matrix, the response, the QR decomposition) are returned.

## **Details**

A monpol object is a type of fitted model object. it has methods for the generic function coef, fitted, formula, logLik, model.matrix, predict, print, residuals.

## Value

```
monpol returns an object of class "monpol"
```

## Author(s)

Berwin A Turlach

#### References

Murray, K., Mueller, S. and Turlach, B.A. (2013). Revisiting fitting monotone polynomials to data, Computational Statistics. Doi:10.1007/s00180-012-0390-5.

# **Examples**

```
monpol(y~x, w0)
```

npol.control Control the Iterations in monp
---

# Description

Allow the user to set some characteristics of the monpol monotone polynomial fitting algorithm.

#### Usage

## **Arguments**

maxiter	A positive integer specifying the maximum number of iterations allowed, used in all algorithms.
tol	A positive numeric value specifying an absolute tolerance for determining whether entries in the gradient are zero for algorithms 'Full', 'BCD', 'CD1' and 'CD2'.
tol1	A positive numeric value, used in algorithm 'Hawkins'. Any number not smaller than -tol1 is deemed to be non-negative.
tol2	A positive numeric value, used in algorithm 'Hawkins'. Any number whose absolute value is smaller than tol2 is taken to be zero.
tolqr	A positive numeric value, used in algorithm 'Hawkins' as tolerance for the QR factorisation of the design matrix.

monpol.fit 7

#### Value

A list with exactly five components:

maxiter
tol
tol1
tol2
tolqr

with meanings as explained under 'Arguments'.

## Author(s)

Berwin A Turlach

#### See Also

```
monpol, monpol.fit, qr
```

## **Examples**

```
monpol.control(maxiter = 2000)
monpol.control(tolqr = 1e-10)
```

monpol.fit

Monotone Polynomials

# Description

This is the basic computing engine called by monpol used to fit monotonic polynomials. These should usually *not* be used directly unless by experienced users.

## Usage

#### **Arguments**

х	vector containing the observed values for the regressor variable.
У	vector containing the observed values for the response variable; should be of same length as $\boldsymbol{x}$ .
W	optional vector of weights; should be of the same length as x if specified.
K	a polynomial with highest power $2K+1$ will be fitted to the data.
start	optional starting value for the iterative fitting.
trace	print out information about the progress of the interative fitting at the start and then every trace iterations.

8 monpol.fit

plot.it plot the data and initial fit, then plot current fit every plot.it iterations. control settings that control the iterative fit; see monpol.control for details.

algorithm algorithm to be used; see monpol for details.

ptype parameterisation to be used; see monpol for details.

ctype parameterisation to be used; see monpol for details.

#### Value

## a list with components

par the fitted parameters.

grad the gradient of the objective function at the fitted parameters.

beta the coefficients of the fitted polynomial in the 'beta' parameterisation; on the

fitted scale.

RSS the value of the objective function; on the fitted scale.

niter number of iterations.

converged indicates whether algorithm has converged.

ptype input parameter ptype. ctype input parameter cptype.

beta.raw the coefficients of the fitted polynomial in the 'beta' parameterisation; on the

original scale.

fitted.values the fitted values; on the fitted scale.
residuals the residuals; on the fitted scale.

K input parameter K.

minx the minimum value in the vector x.

sclx the difference between the maximum and minimum values in the vector x.

miny the minimum value in the vector y.

scly the difference between the maximum and minimum values in the vector y.

algorithm input paramater algorithm.

#### See Also

monpol which you should use for fitting monotonic polynomials unless you know better.

predict.monpol 9

predict.monpol Pre	dicting from Monotone Polynomial Fits
--------------------	---------------------------------------

## Description

predict.monpol produces predicted values, obtained by evaluating the monotone polynomial in the frame newdata.

# Usage

```
## S3 method for class 'monpol'
predict(object, newdata, scale = c("original", "fitted"), ...)
```

## **Arguments**

object	A 'monpol' object.
newdata	A named list or data frame in which to look for variables with which to predict. If newdata is missing the fitted values at the original data points are returned.
scale	Predict values on the original scale of the data or on the scale used during fitting. Data in newdata is assumed to be on the indicated scale.
	Additional optionals arguments. At present no optional arguments are used.

## **Details**

This is the predict method for objects inheriting from class "monpol".

# Value

predict.monpol produces a vector of predictions.

## Author(s)

Berwin A Turlach

|--|

# Description

```
print method for 'monpol' objects.
```

# Usage

```
## S3 method for class 'monpol'
print(x, digits = max(3, getOption("digits") - 3), ...)
```

10 residuals.monpol

## **Arguments**

x A 'monpol' object.

digits minimal number of significant digits, see print.default.

... Additional optionals arguments. At present only those additaion arguments for

coef.monpol are used.

#### **Details**

This is the print method for objects inheriting from class "monpol".

#### Value

x returned invisibly.

## Author(s)

Berwin A Turlach

residuals.monpol

Extract Model Residuals

## **Description**

residuals method for 'monpol' objects.

## Usage

```
## S3 method for class 'monpol'
residuals(object, scale = c("original", "fitted"), ...)
```

## **Arguments**

object A 'monpol' object.

scale Extract residuals on the original scale of the data or on the scale used during

fitting.

... Additional optionals arguments. At present no optional arguments are used.

## **Details**

This is the residuals method for objects inheriting from class "monpol".

## Value

Residuals extracted from the model object object.

#### Author(s)

Berwin A Turlach

w0

w0

Simulated w0 data used in Murray et al. (2013)

## **Description**

This data set gives simulated data from the function

$$y = 0.1x^3 + e$$

for  $e \sim N(0, 0.001^2)$  and x evenly spaced between -1 and 1.

#### **Format**

A data frame with 21 observations on the following 2 variables.

y a numeric vector

x a numeric vector

#### Source

Murray, K., Müller, S. and Turlach, B.A. (2013). Revisiting fitting monotone polynomials to data, Computational Statistics. Doi:10.1007/s00180-012-0390-5.

## **Examples**

```
str(w0)
plot(y~x, w0)
monpol(y~x, w0)
```

w2

Simulated w2 data used in Murray et al. (2013)

# Description

Simulated data from the function

$$y_{ij} = 4\pi - x_i + \cos(x_i - \frac{\pi}{2}) + e_{ij}$$

for  $x_i=0,1,\ldots,12$  ;  $n_i=5$  for i=0 and  $n_i=3$  otherwise;  $e_{ij}\sim N(0,0.5^2)$ 

#### **Format**

A data frame with 41 observations on the following 2 variables.

y a numeric vector

x a numeric vector
