2 evalPol

coef.monpol

Extract Model Coefficients

Description

coef method for 'monpol' objects.

Usage

```
## S3 method for class monpol
coef(object, scale = c("original", "fitted"), type = c("beta", "monpar"), ...)
```

Arguments

| object | A 'monpol' object. |
|--------|---|
| scale | Extract coefficients on the original scale of the data or on the scale used during fitting. |
| type | Extract coefficients in the 'beta' parameterisation of the polynomial or for the monotone parameterisation used in the algorithm. |
| | Additional optionals arguments. At present no optional arguments are used. |

Details

This is the coef method for objects inheriting from class "monpol".

Value

Coefficients extracted from the model object object.

Author(s)

Berwin A Turlach

evalPol

Evaluating Polynomials

Description

Function to evaluate polynomials in a numerical robust way using the Horner scheme

Usage

```
evalPol(x, beta)
```

Arguments

x numerical values at which to evaluate polynomials, can be provided in a vector,

matrix, array or data frame

beta numerical vector containing the coefficient of the polynomial

fitted.monpol 3

Value

The result of evaluating the polynomial at the values in x, returned in the same dimension as x has.

Author(s)

Berwin A Turlach

Examples

```
## The function is currently defined as
function (x, beta)
    res <- 0
    for(bi in rev(beta))
     res <- res*x + bi
    res
  }
beta <- c(1,2,1)
x <- 0:10
evalPol(x, beta)
str(evalPol(x, beta))
x <- cbind(0:10, 10:0)
evalPol(x, beta)
str(evalPol(x, beta))
x \leftarrow data.frame(x=0:10, y=10:0)
evalPol(x, beta)
str(evalPol(x, beta))
```

fitted.monpol

Extract Model Fitted Values

Description

fitted method for 'monpol' objects.

Usage

```
## S3 method for class monpol
fitted(object, scale = c("original", "fitted"), ...)
```

Arguments

object A 'monpol' object.

scale Extract fitted values on the original scale of the data or on the scale used during fitting.

... Additional optionals arguments. At present no optional arguments are used.

Details

This is the fitted method for objects inheriting from class "monpol".

Value

Fitted values extracted from the model object object.

Author(s)

Berwin A Turlach

hawkins

hawkins

Description

This data gives x and y variables for the data published in Hawkins' 1994 article. This data was originally simulated from a standard cubic polynomial with equally spaced x values between -1 and 1.

Format

A data frame with 50 simulated observations on the following 2 variables.

```
y a numeric vector
```

x a numeric vector

References

Hawkins, D. M. (1994) Fitting monotonic polynomials to data. *Computational Statistics* **9**(3): 233–247.

Examples

```
data(hawkins)
```

model.matrix.monpol

Construct Design Matrices

Description

model.matrix creates a design (or model) matrix for 'monpol' objects.

Usage

```
## S3 method for class monpol
model.matrix(object, scale = c("original", "fitted"), ...)
```

monpol 5

Arguments

object A 'monpol' object.

scale Create design matrix on the original scale of the data or on the scale used during

itting.

... Additional optionals arguments. At present no optional arguments are used.

Details

This is the model.matrix method for objects inheriting from class "monpol".

Value

Design matrix created from the model object object.

Author(s)

Berwin A Turlach

monpol

Monotone Polynomials

Description

Determine the least-squares estimates of the parameters of a monotone polynomial

Usage

```
monpol(formula, data, subset, weights, na.action,
    degree=3, K, start, trace = FALSE, plot.it = FALSE,
    control = monpol.control(),
    algorithm = c("Full", "Hawkins", "BCD", "CD1", "CD2"),
    ptype = c("Elphinstone", "EHH", "Penttila"),
    ctype = c("cge0", "c2"),
    model=FALSE, x=FALSE, y=FALSE)
```

Arguments

| formula | an object of class "formula" (or one that can be coerced to that class): a symbolic description of the model to be fitted. |
|---------|---|
| data | an optional data frame, list or environment (or object coercible by as.data.frame to a data frame) containing the variables in the model. If not found in data, the variables are taken from environment(formula), typically the environment from which monpol is called. |
| subset | an optional vector specifying a subset of observations to be used in the fitting process. |
| weights | an optional vector of weights to be used in the fitting process. Should be NULL |

or a numeric vector.

6 monpol

| na.action | a function which indicates what should happen when the data contain NAs. The default is set by the na.action setting of options, and is na.fail if that is unset. The 'factory-fresh' default is na.omit. Another possible value is NULL, no action. Value na.exclude can be useful. |
|-------------|--|
| degree | a polynomail with highest power equal to degree will be fitted to the data. |
| K | a polynomial with highest power $2K+1$ will be fitted to the data. |
| start | optional starting value for the iterative fitting. |
| trace | print out information about the progress of the interative fitting at the start and then every trace iterations. |
| plot.it | plot the data and initial fit, then plot current fit every plot.it iterations. |
| control | settings that control the iterative fit; see monpol.control for details. |
| algorithm | algorithm to be used. It is recommended to use either 'Full' or 'Hawkins'; see paper in 'References' for details. |
| ptype | parameterisation to be used; see paper in 'References' for details. |
| ctype | parameterisation to be used; see paper in 'References' for details. |
| model, x, y | logicals. If TRUE the corresponding components of the fit (the model frame, the model matrix, the response, the QR decomposition) are returned. |

Details

A monpol object is a type of fitted model object. it has methods for the generic function coef, fitted, formula, logLik, model.matrix, predict, print, residuals.

Value

monpol returns an object of class "monpol"

Author(s)

Berwin A Turlach

Examples

monpol(y~x, w0)

monpol.control 7

Description

Allow the user to set some characteristics of the monpol monotone polynomial fitting algorithm.

Usage

Arguments

| maxiter | A positive integer specifying the maximum number of iterations allowed, used in all algorithms. |
|---------|---|
| tol | A positive numeric value specifying an absolute tolerance for determining whether entries in the gradient are zero for algorithms 'Full', 'BCD', 'CD1' and 'CD2'. |
| tol1 | A positive numeric value, used in algorithm 'Hawkins'. Any number not smaller than -tol1 is deemed to be non-negative. |
| tol2 | A positive numeric value, used in algorithm 'Hawkins'. Any number whose absolute value is smaller than to12 is taken to be zero. |
| tolqr | A positive numeric value, used in algorithm 'Hawkins' as tolerance for the QR factorisation of the design matrix. |

Value

```
A list with exactly five components:
```

maxiter
tol
tol1
tol2

tolqr

with meanings as explained under 'Arguments'.

Author(s)

Berwin A Turlach

See Also

```

```

Examples

```
monpol.control(maxiter = 2000)
monpol.control(tolqr = 1e-10)
```

8 monpol.fit

| monpol.fit | Monotone Polynomials | |
|------------|----------------------|--|
| | | |

Description

This is the basic computing engine called by monpol used to fit monotonic polynomials. These should usually *not* be used directly unless by experienced users.

Usage

Arguments

| X | vector containing the observed values for the regressor variable. |
|-----------|--|
| У | vector containing the observed values for the response variable; should be of same length as \boldsymbol{x} . |
| W | optional vector of weights; should be of the same length as x if specified. |
| K | a polynomial with highest power $2K+1$ will be fitted to the data. |
| start | optional starting value for the iterative fitting. |
| trace | print out information about the progress of the interative fitting at the start and then every trace iterations. |
| plot.it | plot the data and initial fit, then plot current fit every plot.it iterations. |
| control | settings that control the iterative fit; see monpol.control for details. |
| algorithm | algorithm to be used; see monpol for details. |
| ptype | parameterisation to be used; see monpol for details. |
| ctype | parameterisation to be used; see monpol for details. |

Value

a list with components

| par | the fitted parameters. |
|-----------|--|
| grad | the gradient of the objective function at the fitted parameters. |
| beta | the coefficients of the fitted polynomial in the 'beta' parameterisation; on the fitted scale. |
| RSS | the value of the objective function; on the fitted scale. |
| niter | number of iterations. |
| converged | indicates whether algorithm has converged. |
| ptype | input parameter ptype. |
| ctype | input parameter cptype. |

predict.monpol 9

beta.raw the coefficients of the fitted polynomial in the 'beta' parameterisation; on the

original scale.

fitted.values the fitted values; on the fitted scale. residuals the residuals; on the fitted scale.

K input parameter K.

minx the minimum value in the vector x.

sclx the difference between the maximum and minimum values in the vector x.

miny the minimum value in the vector y.

scly the difference between the maximum and minimum values in the vector y.

algorithm input paramater algorithm.

See Also

monpol which you should use for fitting monotonic polynomials unless you know better.

predict.monpol Predicting from Monotone Polynomial Fits

Description

predict.monpol produces predicted values, obtained by evaluating the monotone polynomial in the frame newdata.

Usage

```
## S3 method for class monpol
predict(object, newdata, scale = c("original", "fitted"), ...)
```

Arguments

object A 'monpol' object.

newdata A named list or data frame in which to look for variables with which to predict.

If newdata is missing the fitted values at the original data points are returned.

scale Predict values on the original scale of the data or on the scale used during fitting.

Data in newdata is assumed to be on the indicated scale.

.. Additional optionals arguments. At present no optional arguments are used.

Details

This is the predict method for objects inheriting from class "monpol".

10 print.monpol

Value

predict.monpol produces a vector of predictions.

Author(s)

Berwin A Turlach

print.monpol

Printing Monotone Polynomials

Description

print method for 'monpol' objects.

Usage

```
## S3 method for class monpol
print(x, digits = max(3, getOption("digits") - 3), ...)
```

Arguments

```
    x A 'monpol' object.
    digits minimal number of significant digits, see print.default.
    ... Additional optionals arguments. At present only those additaion arguments for coef.monpol are used.
```

Details

This is the print method for objects inheriting from class "monpol".

Value

x returned invisibly.

Author(s)

Berwin A Turlach

residuals.monpol 11

residuals.monpol

Extract Model Residuals

Description

residuals method for 'monpol' objects.

Usage

```
## S3 method for class monpol
residuals(object, scale = c("original", "fitted"), ...)
```

Arguments

object A 'monpol' object.

scale Extract residuals on the original scale of the data or on the scale used during

fitting.

... Additional optionals arguments. At present no optional arguments are used.

Details

This is the residuals method for objects inheriting from class "monpol".

Value

Residuals extracted from the model object object.

Author(s)

Berwin A Turlach

w0

Simulated w0 data used in Murray et al. (2013)

Description

This data set gives simulated data from the function

$$y = 0.1x^3 + e$$

for $e \sim N(0, 0.01^2)$ and x evenly spaced between -1 and 1.

Format

A data frame with 21 observations on the following 2 variables.

y a numeric vector

x a numeric vector

12 w2

Source

Murray, K., Mueller, S. and Turlach, B.A. (2013). Revisiting fitting monotone polynomials to data, *Computational Statistics* **28**(5): 1989–2005. Doi:10.1007/s00180-012-0390-5.

Examples

```
str(w0)
plot(y~x, w0)
monpol(y~x, w0)
```

w2

Simulated w2 data used in Murray et al. (2013)

Description

Simulated data from the function

$$y_{ij} = 4\pi - x_i + \cos(x_i - \frac{\pi}{2}) + e_{ij}$$

for $x_i=0,1,\ldots,12$; $n_i=5$ for i=0 and $n_i=3$ otherwise; $e_{ij}\sim N(0,0.5^2)$

Format

A data frame with 41 observations on the following 2 variables.

y a numeric vector

x a numeric vector

Source

Murray, K., Mueller, S. and Turlach, B.A. (2013). Revisiting fitting monotone polynomials to data, *Computational Statistics* **28**(5): 1989–2005. Doi:10.1007/s00180-012-0390-5.

Examples

```
str(w2)
plot(y~x, w2)
monpol(y~x, w2)
monpol(y~x, w2, K=2)
```
